

Coburn Enterprises.com Recommends iPiccy for photo editing.

To make sure your website always looks good and runs at its best you should always use “web ready” pictures. This is easy with “iPiccy” FREE image editing tools. (There are lots of cool things you can do but for our purposes this article shows the basic optimization you should do on any image before using it on your website.)

Go to: <http://ipiccy.com> (it will take a minute to get to the initial screen). When you get there click “Start Editing”

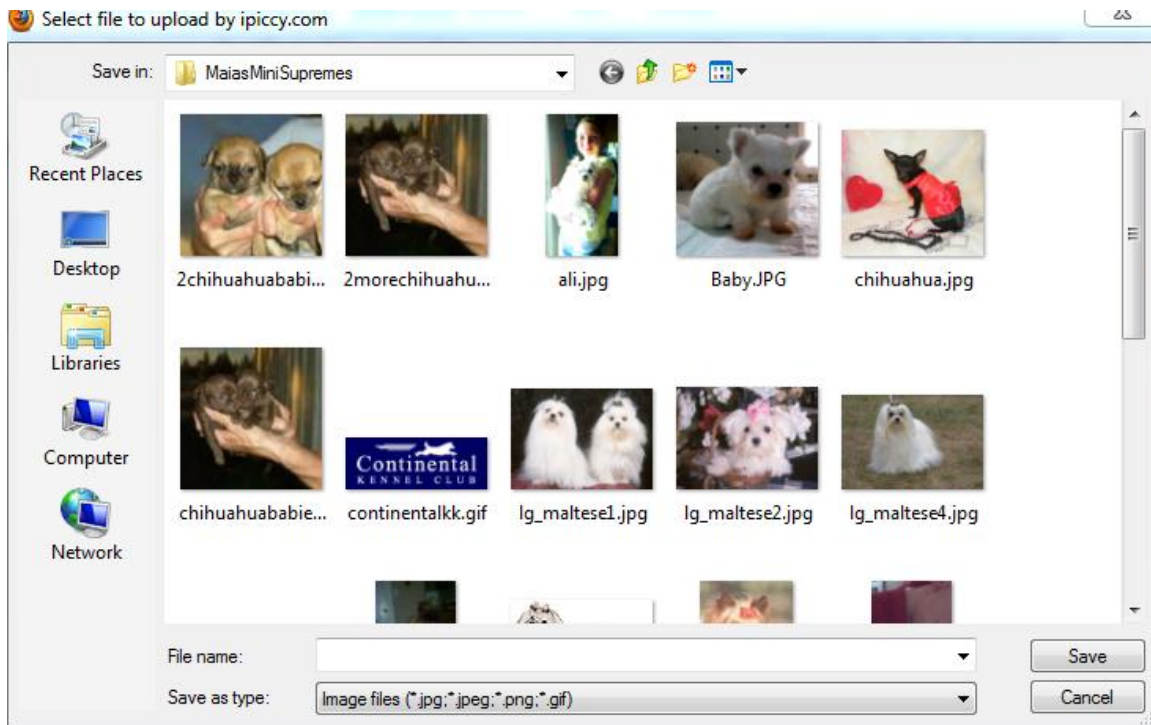

Click on Upload a Photo

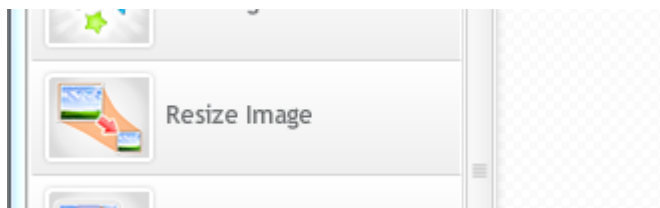

You will be taken through the steps to get the photo off of your computer:

First you will find it. Then you will click “Save”.

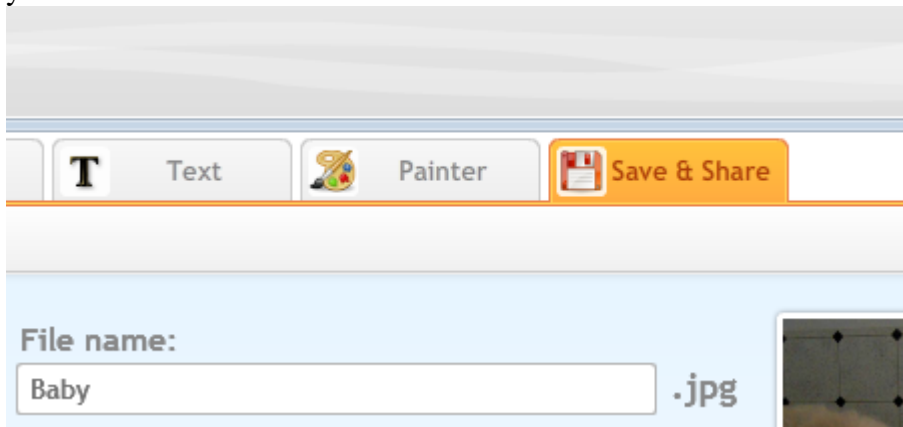

Then you'll be taken back to a new screen with several buttons on the left. We are only concerned with sizing. So you will click the Resize image button. We recommend you keep your pictures at 600pixels wide or less.

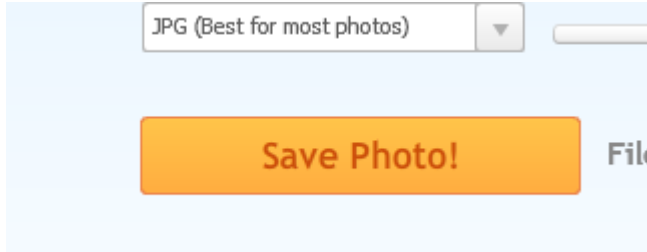

Set your image size in the box that opens. And then click apply.

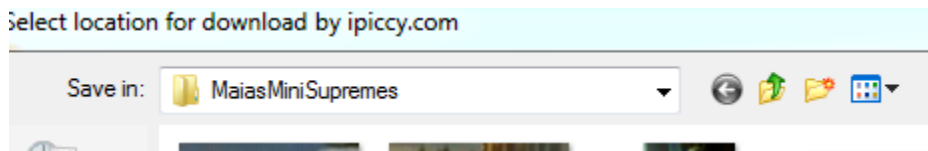

Once you have resized the picture you are ready to save it to your computer for use in your website. Click on the Save & Share tab.

Click on Save Photo.

Navigate to a folder on your computer (or create a new one) to save your “web ready” pictures into. Then click Save. (Note the location your image is being saved to by looking at the “Save in” field.)

Ok, now you are ready to start the process for the next picture!

Just go back to the tab titled Get Picture and start the process over again.
